List of Tables

1.1 Phase transition of minerals at depths corresponding to seismic discontinuity. (Ref.[45]) 8

3.1 Calculated structural parameters, elastic modulus, elastic constants and sound velocities of δ-AlOOH at 0 GPa. 38

3.2 Pressure derivative (Pr. Drv) of elastic moduli of δ-AlOOH. 43

4.1 Lattice parameters and volume of $Mg(OH)_2$ obtained from XRPD measurements and DFT calculations using vdw-DF2 functional. 60

4.2 Experimentally measured and DFT calculated frequencies (in cm^{-1}) of brucite in comparison with the available theoretical and experimental data. 62

4.3 Elastic constants, elastic modulus (GPa), and sound wave velocites (shear and longitudinal in km s^{-1}) of brucite at 0 GPa. The calculated values are compared with reported data. (*Calculation performed on P-3 unit cell. V, R and VHR denotes Voigt, Reuss and the Voigt–Reuss–Hill average, respectively) 63

4.4 Unit-cell parameters and bulk modulus of β-$Co(OH)_2$ from our study in comparison with previously reported works 72

4.5 Experimental and theoretical lattice parameters of β-$Ni(OH)_2$ in comparison with reported data. 79

5.1 Calculated structural parameters of monoclinic lawsonite at 10 GPa compared with the available data for the closest pressure value reported. . . . 92
