MAIN SERIES OF EXPERIMENTS:

" Biochemical studies on algal-bacterial symbiosis in Laboratory Model-high-rate aerobic ponds using *Chlorella vulgaris*. *Euglena gracilis* and *Microcystis aeruginosa*.

CHAPTER - I.		Introduction	... 1-7
CHAPTER - II.		Literature review	... 8-13
CHAPTER - III.		Materials and Methods	... 16-30
1.		TEST CONDITIONS:	
	(a)	The algal culture room	... 16
	(b)	Lighting arrangements in the algal culture room	... 16
	(c)	Temperature of the algal culture room	... 16
	(d)	The intensity of illumination	... 17
	(e)	Isolation, acclimalization and maintenance of stock algal cultures for the laboratory scale experiments.	... 17
	(f)	Laboratory set up of the apparatus for experiments on algal-bacterial symbiosis.	... 19
2.	(a)	Sample collection for analysis	... 20
	(b)	Sterility tests of the laboratory equipment and media.	... 20
3.		Bacteriological Examination:	
	(i)	Object of the examination	... 21
	(ii)	Three types of tests	... 21
	(ii-1)	Coliform group	... 21
	(ii-2)	Total colonies count at 37°C after 24 hours.	... 21

PAGE NO:

(ii-3)	Isolation of heterotrophic non-photosynthetic bacteria on sewage agar at room temperature.	...	21
(ii-4)	Typing and characterization of heterdtrophic non-photosynthetic bacterial isolates.	...	22
(ii-5.1)	Morphological traits	...	22
(ii-5.2)	Staining reactions	...	22
(ii-5.3)	Tests for reserve materials or storage products.	...	24
(ii-5.4)	Biochemical tests	...	24
(ii-5.5)	Classification and identity of the genera of the bacteria.	...	25
4.	Biological Examination:		
(i)	Microscopic	...	26
(ii)	Algal bio-mass	...	26
	(a) Dry weight	...	26
	(b) N and P content	...	27
(iii)			
5.	Physico chemical conditions		
(a)	Physical conditions:		
(i)	Colour	...	27
(ii)	Temperature	...	27
(iii)	PH	...	27
(b)	Chemical conditions:		
(b1)	Ammonia nitrogen	...	27
(b2)	Nitrite-nitrogen	...	27
(b3)	Nitrate nitrogen	...	28
(b4)	Phosphate	...	28
(b5)	Alkalinity(Phenolphthalein)	...	28

PAGE NO:

5. (b6) BOD_5 at 20°C ... 28

(b7) COD ... 28

6. Biochemical tests using Microcystis aeruginosa.

(i) Carbohydrates ... 29

(ii) Protein ... 29

(iii) Amino-nitrogen ... 29

(iv) Volatile acids ... 30

CHAPTER - IV: Experimental Results:

1. Physical conditions ... 32

2. Chemical conditions ... 32

3. Biological conditions ... 34

4. Biochemical conditions ... 35

5. Bacteriological results ... 36

CHAPTER - V: Discussion of Results:

Main series of experiments with the two algae, using Chlorella vulgaris and Euglena gracilis:

(a) Bacterial oxidation of polluting organic matter. ... 41

1. Theory of bio-oxidation ... 41

2. Application of the theory to the results. ... 42

i. Removal of polluting organic matter as COD ... 42

ii. Conversion of COD values into organic matter values according to Porges (1960) ... 44

iii. Oxygen required for total bio-oxidation according to Oswald et al (1958) 's equation. ... 44

iv. Carbon-dioxide released by bacterial oxidation ... 44

PAGE NO

v. O_2 required and CO_2 released during bio-oxidation of sewage organic matter according to Oswald et al (1958) ... 45

vi. Bacterial growth and synthesis according to Sawyer.(1956) ... 45

vii. Total, active and decreasing bacterial biomass according to Mckinney(1962) ... 46

viii. Different phases of Microbial metabolism ... 46

(b) Algal photosynthesis with Chlorella and Euglena: ... 49

1. Theoritical considefations ... 49

2. Application to the connected results ... 52

i. Carbon dioxide used up during algal biomass production. ... 52

ii. Quantity of photosynthetic oxygen released into the ecosystem. ... 52

(c) In-put Out-put energy balance

1. Theoritical considerations ... 52

2. Application to the results ... 54

(d) Algal-bacterial symbiosis in high-rate aerobic ponds: ... 54

1. Theoritical considerations. ... 54

2. Application to related results ... 55

i. Quantity of oxygen released during algal photosynthesis compared with the quantity of oxygen required for total bacterial oxidation of pollu--ting organic matter of Baroda Sewage. ... 55

ii. Carbondioxide-released during total biooxidation of polluting organic matter compared with the quantity used up for algal biomass production in algal bacterial symbiosis. ... 56

iii. Explanation for the excess of carbon dioxide used up during algal photo--synthesis in algal bacterial symbiosis ... 57

PAGE NO:

(e) Regression analysis of nutrient strength expressed as COD and algal bio-mass; and their correlation coefficients: ... 57

1. Theoritical considerations ... 57

2. Application to the connected results ... 58

(f) Bio-stimulatory nutrients and their removal during algal photosynthesis.

1. Theoritical considerations ... 58

2. Application to the connected results ... 59

(i) 3. Phosphorus as PO_4 ... 59

(ii) 4. Nitrogen as Am-N ... 61

(g) 5. Biological conditions ... 62

(h) 6. Biochemical conditions ... 63

(i) 7. Bacteriological results ... 63

(j) 8. Bacteria in action in high-rate aerobic ponds. ... 67

(k) 9. Basic facts about the metabolic reactions taking place in an activated sludge process. ... 67

CHAPTER - VI:

Why total oxidation is impossible in high-rate oxidation ponds:

a) An account of the working of a high rate aerobic ponds. ... 71

b) Microbes in action in high-rate aerobic ponds. ... 77

c) "Complete" and "constant" sludge volume in activated sludge process and high-rate aerobic pond. ... 78

d) "Is total oxidation possible? ... 78

e) "A constant volume" of sludge in high-rate aerobic ponds. ... 79

PAGE NO:

CHAPTER - VII

Advantages of using high-rate aerobic oxidation ponds:

i) Production of power from solar energy by means of algae. ... 81

ii) Production of large scale and cheap algal protein ... 82

iii) Preventing eutrophication of receiving waters. ... 82

iv) Helpful in softening hard waters. ... 83

v) For establishing industrialised food production complexes. ... 83

vi) Economics of nitrogen utilisation in high-rate aerobic oxidation ponds. ... 84

vii) Salvaging sea water for algal protein ... 85

Summary ... 86-87

Conclusion ... 88-90

References ... 91-103

Tabular Statements ... 104-113
